

NEED EXTRA STORAGE? CONCRETE CISTERN TANKS

Livestock water is essential for the life, growth, and reproduction of your animals. Livestock should have access to water at all times. Deficiency in the quantity of water will decrease the performance of your livestock. The typical average water consumption for a beef cow is approximately 45 gallons per day, with that quantity rising an average of 10 gallons per day during the summer months.

To provide ample water for your livestock consider extra storage with concrete cisterns. Boom Concrete Cisterns are available in three sizes: 1,200 gallons, 1,850 gallons, and 2,900 gallons. Combine several cisterns to get your needed storage capacity.

BOOM CONCRETE CISTERN tanks are designed and built with high quality components including specially formulated concrete, steel rebar, and concrete fiber, which is embedded throughout the tank.

Combine cisterns for needed storage capacity.
